Toxicity Mitigation and Solidification of MSW Incinerator Fly Ash Using Alkaline Activated Coal Ash

World of Coal Ash, Denver, CO, May 9-12

Presenter: E. Ivan Diaz-Loya

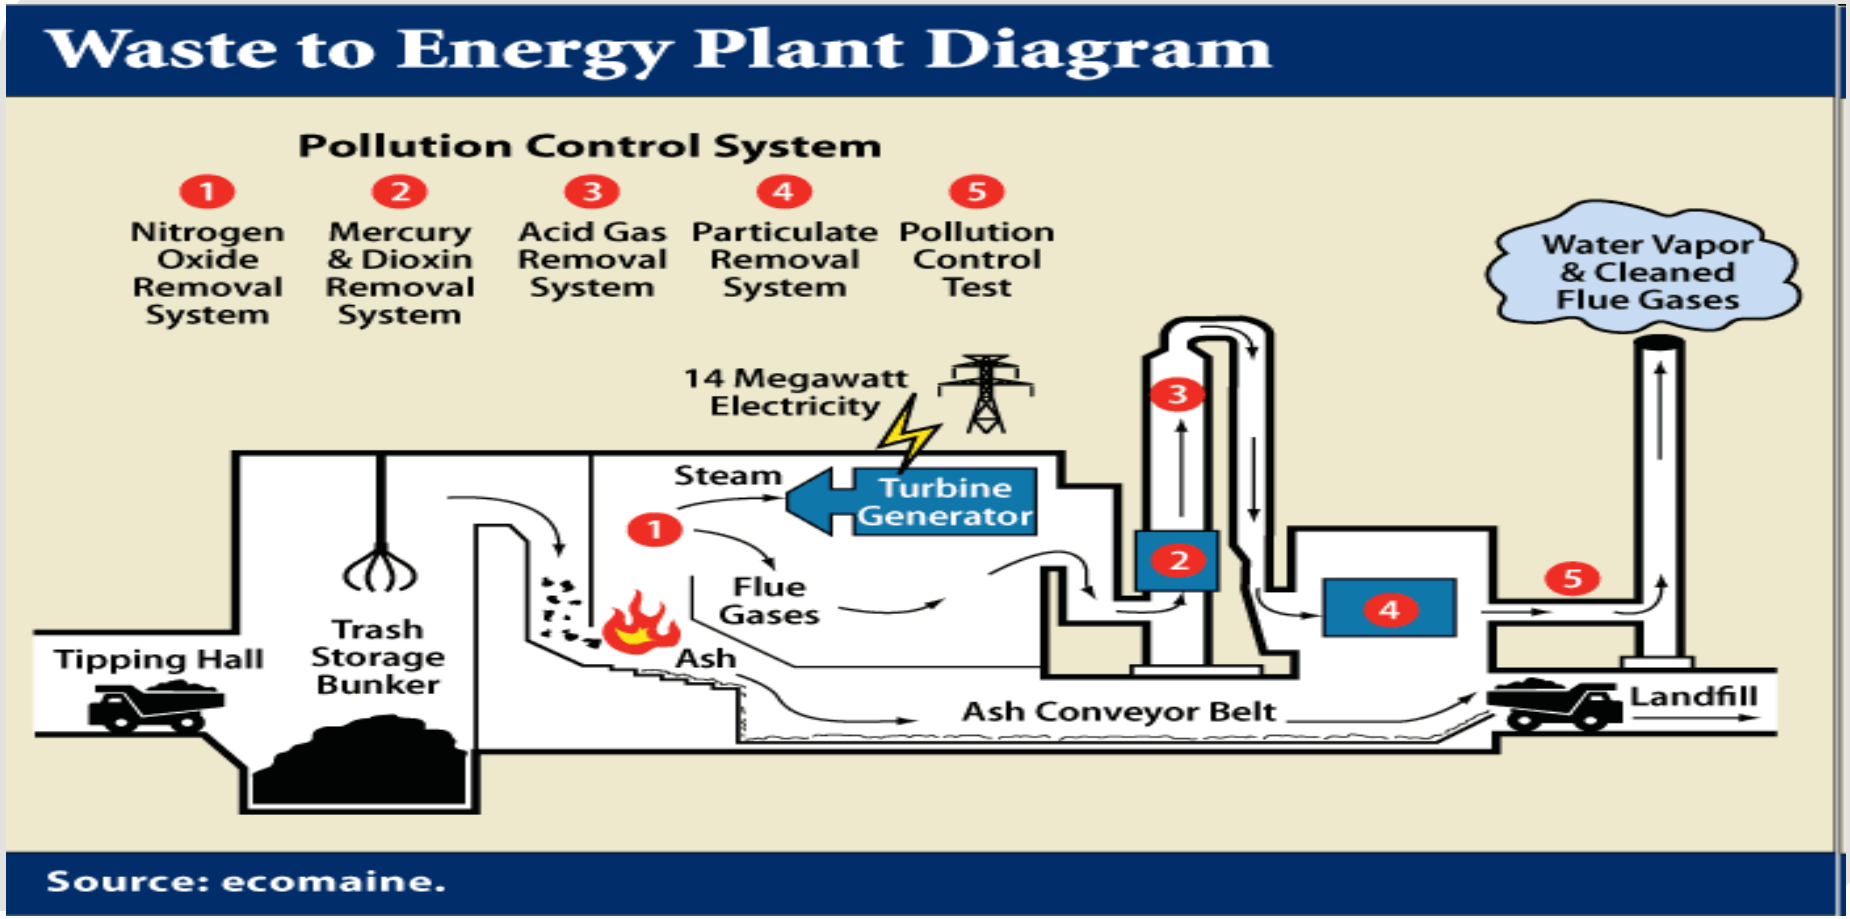
•*Dr. Erez N. Allouche, Dr. Sven Eklund, Anupam Joshi*

Trenchless Technology Center
Louisiana Tech University

Outline

- MSW Incineration
- Mechanism of Stabilization/Solidification in GPC
- Experimental Plan
- Results
- Conclusion

Municipal Solid Waste Incineration



Municipal Solid Waste Incineration

ADVANTAGES

- Solid waste reduction of up to 90% by volume
- Energy recovery (in some cases)
- Sustainable solid waste management

DISADVANTAGES

- Dioxins and Furans
- CO2,NOx & SOx emissions
- Heavy metals and salts
- Cost

Those in Favor…

Those Against…

~~Homer Simpson~~
~~World Health Org~~ Guide
To Chosing A Site for TOXIC Waste Incinerators

First, Get your hands a site.

Then, Make sure its:

~~Not~~ on a Gas Pipeline √
~~Not~~ on a Flood Plain √
~~Not~~ next to Schools, colleges prisons etc √
~~Not~~ subject to coastal erosion √
~~Not~~ in a valley prone to fogginess √
~~Not~~ in an area with any tourist value √
~~Definitely not~~ with an exploding metal works in it's centre √
Not on a volcano or earthquake √

Ringaskiddy √√√

Current treatment Methods of IFA

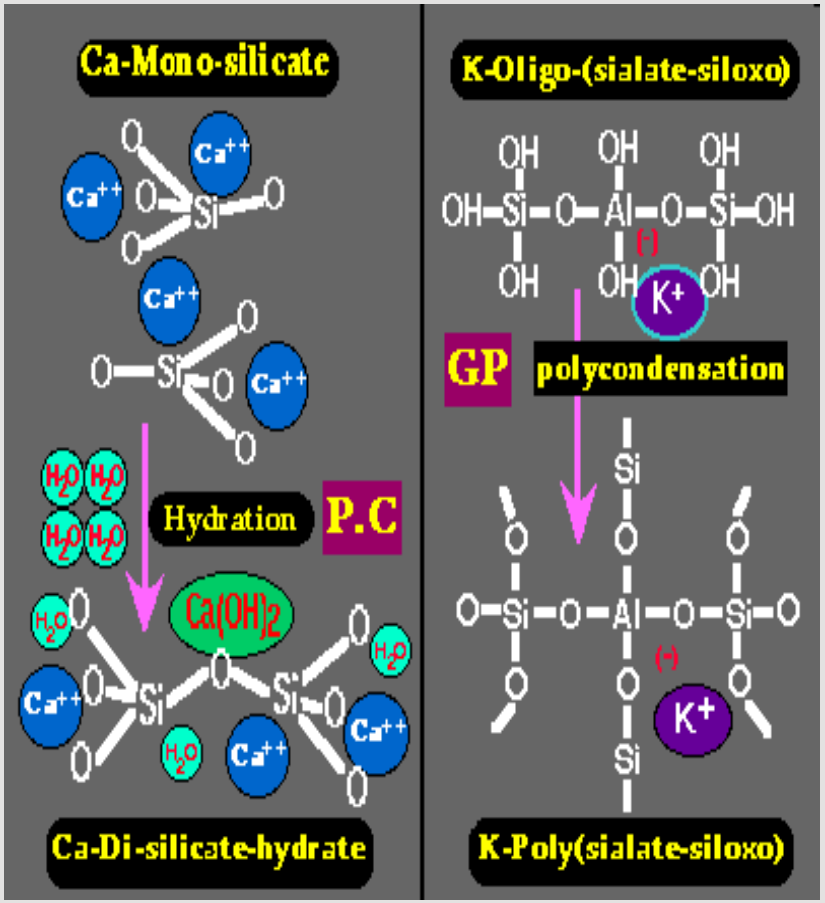
- Chemical washing
- Extraction and chloride evaporation
- Vitrification
- Soliroc

Disadvantages

- Expensive
- Energy consumption
- Generate other waste
- Product not to be used due to its toxicity

Immobilization/Stabilization Mechanism in a Geopolymer Network

1. Metal ions are taken into the geopolymer network
2. They assume charge balancing roles
3. Remaining metal iones are physically encapsulated in the geopolymer matrix



Experimental Plan

- Gradually substitute Coal-derived fly ash (CFA) with Incinerator fly ash (IFA) in a geopolymer matrix
  1. Control sample of CFA designated as 00-100
  2. 20% of CFA was substituted by IFA, this mixture was labeled as 20-80
  3. 40, 60, 80 and finally a control sample of IFA labeled as mixtures 40-60, 60-40, 80-20 and 100-00, respectively

Tests

Fly Ash

- Chemical analysis (XRF)
- Crystallographic characteristics (XRD)
- Particle size distribution (Laser based)
- Particle Morphology (SEM)
- Leaching Tests (EPA's TCLP)

Concrete

- Compressive strength
- Flexural strength
- Elastic modulus
- Poisson's ratio
- Setting time
- Leaching Tests

Chemical Analysis

IFA-CFA Oxide.	00-100	20-80	40-60	60-40	80-20	100-00

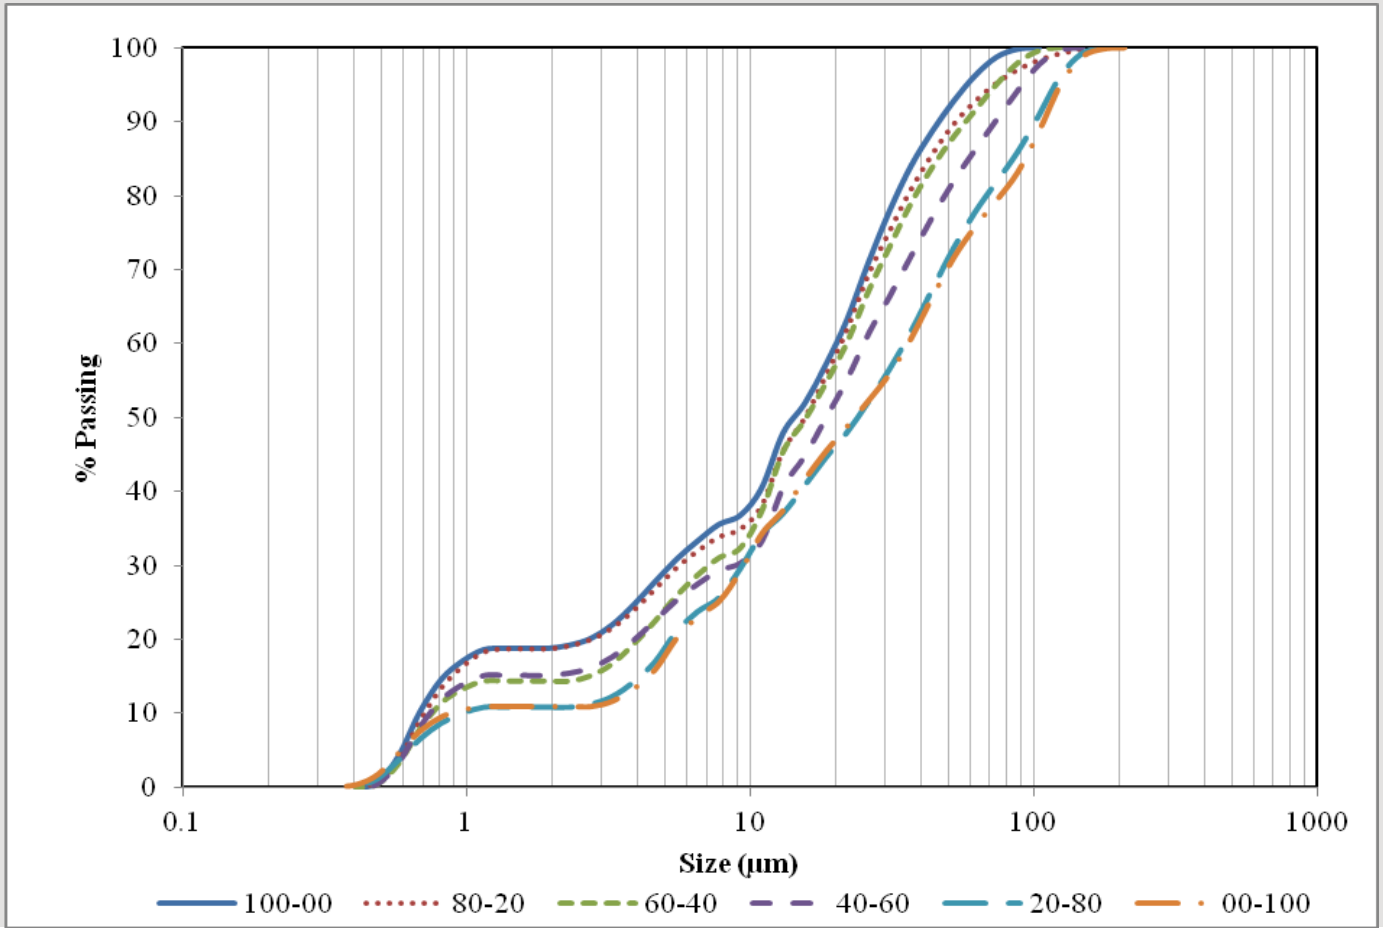
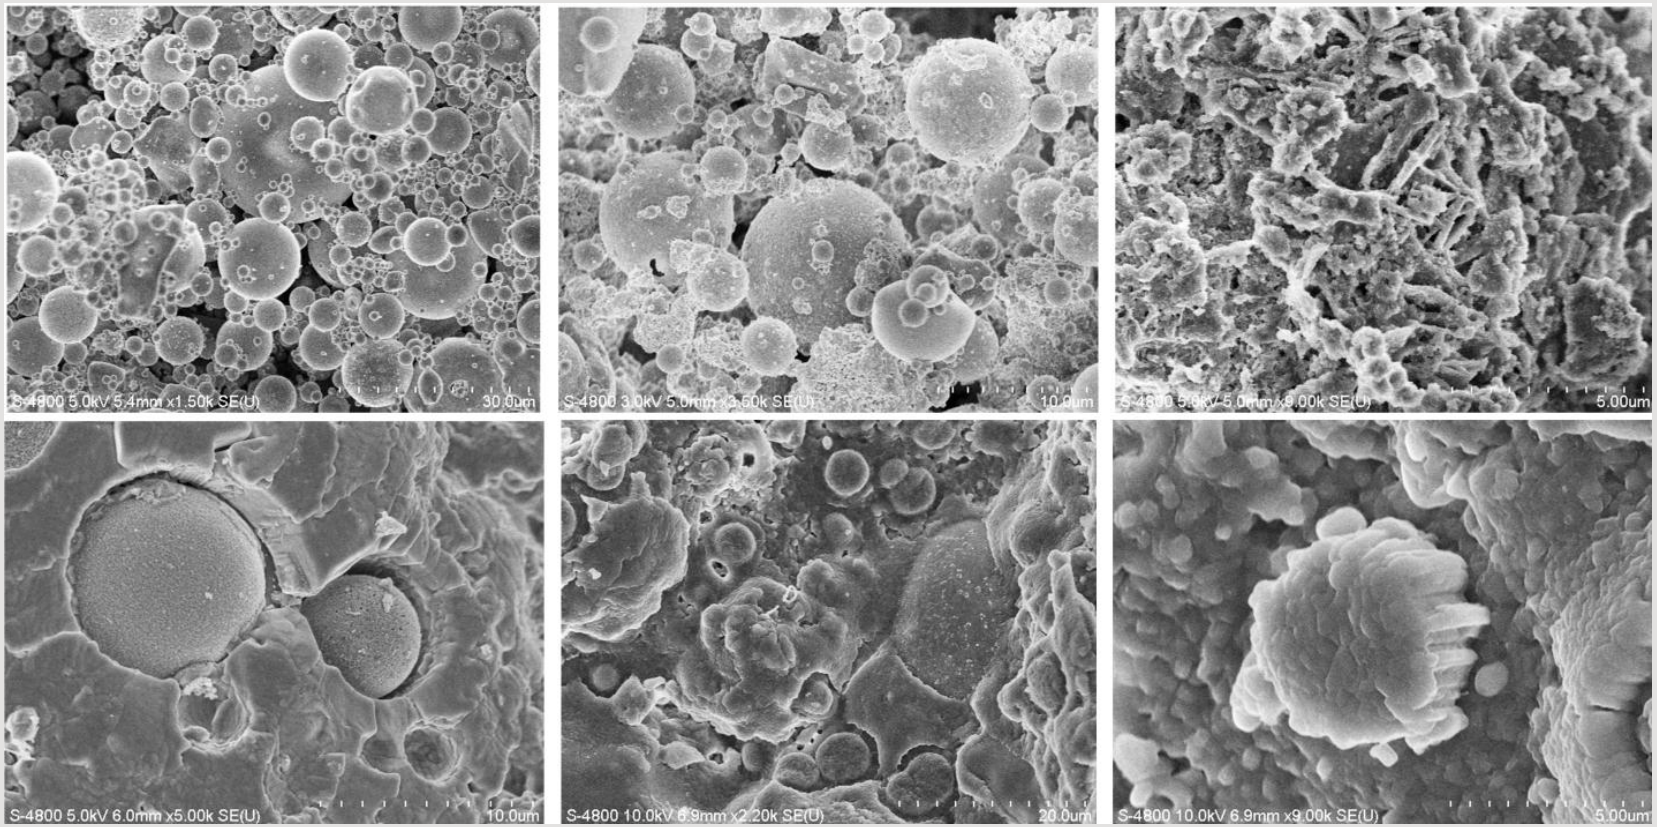
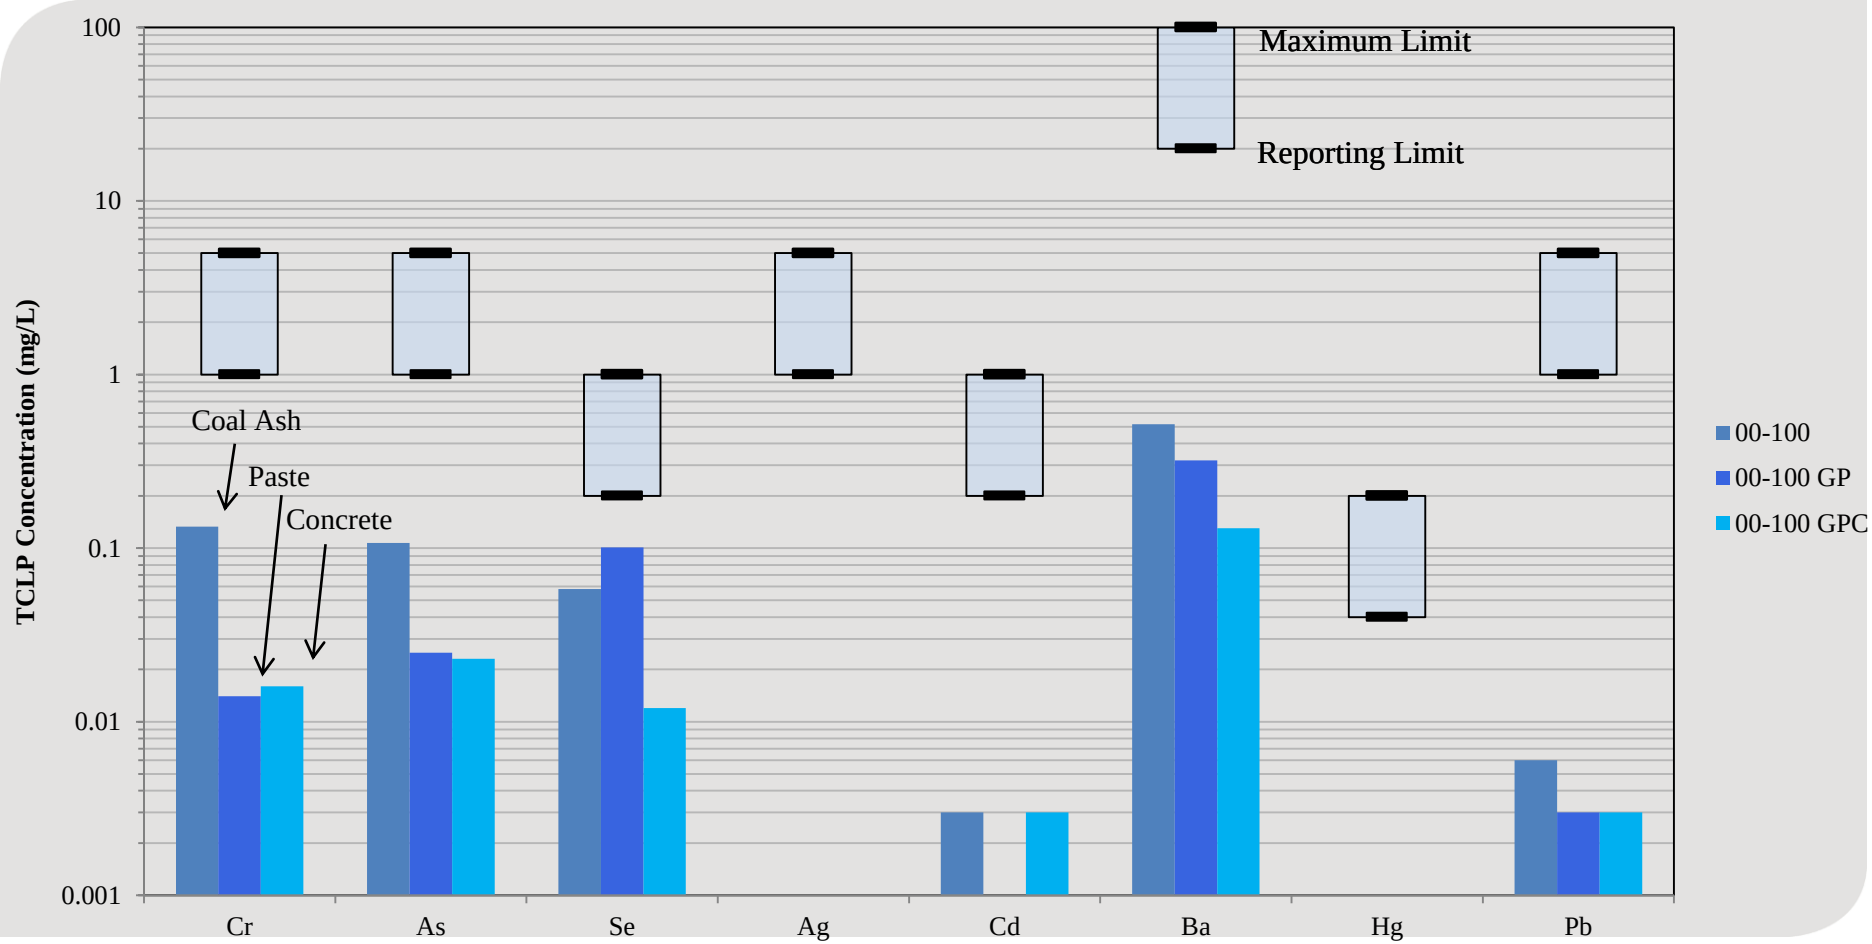
Particle Size Distribution



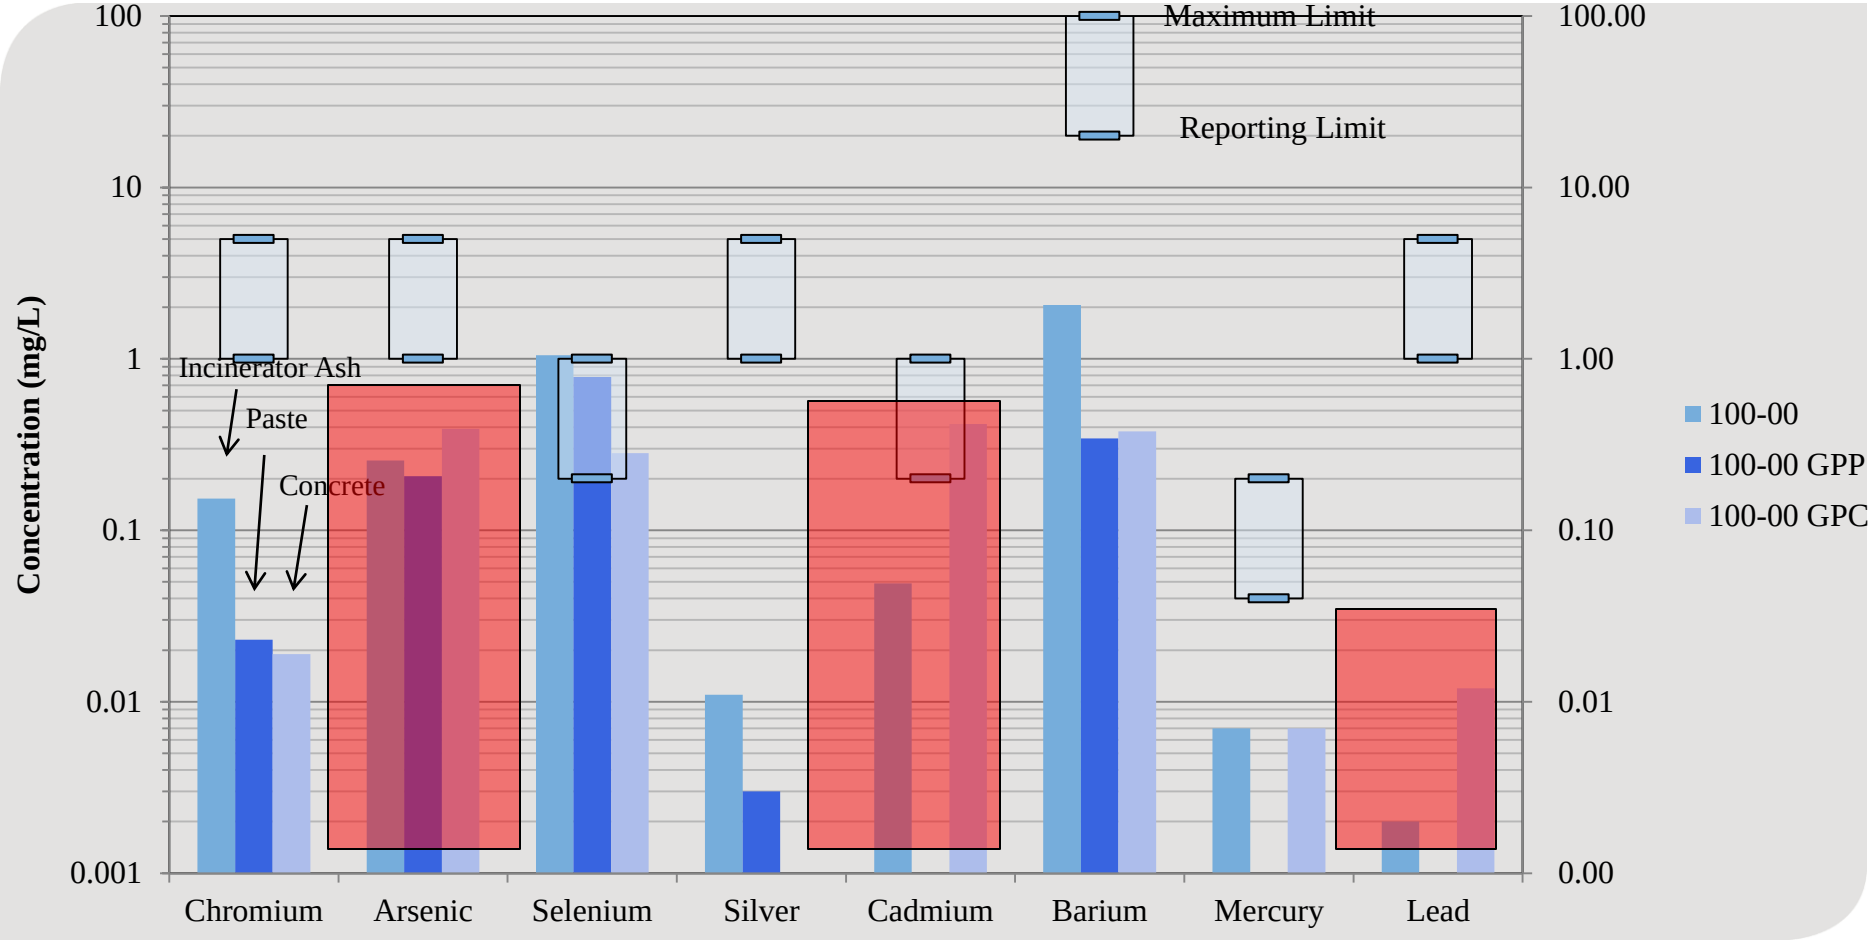
Scanning Electron Microscopy



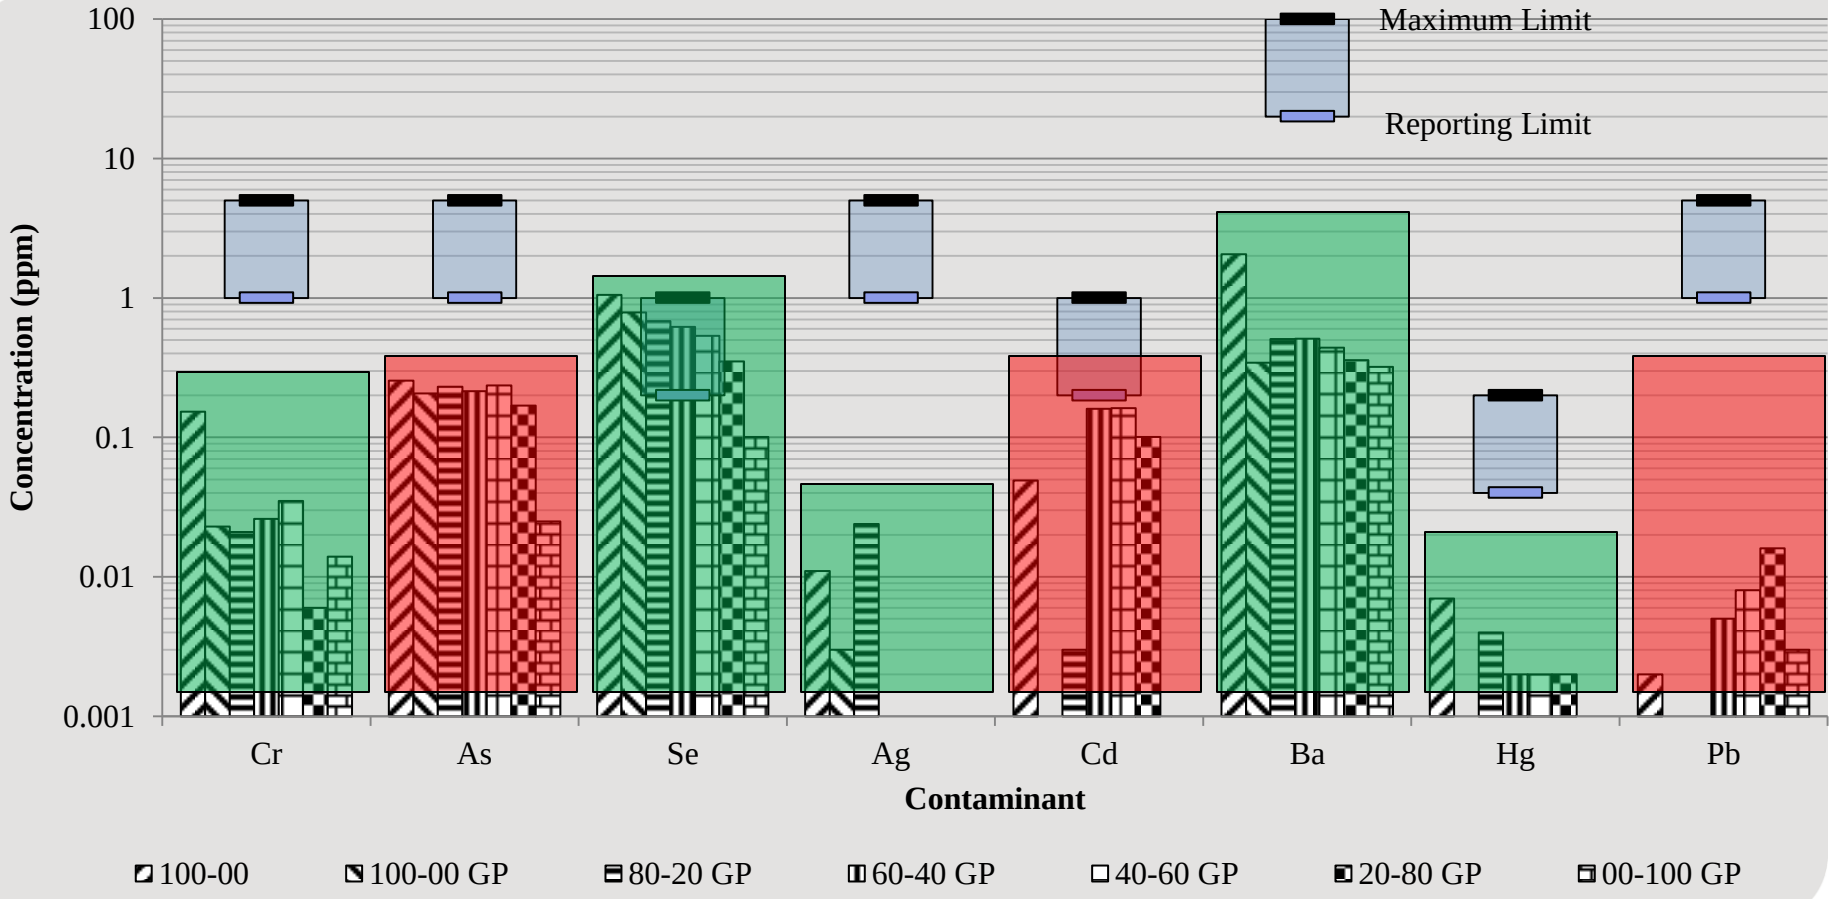
Leaching of Coal Fly Ash



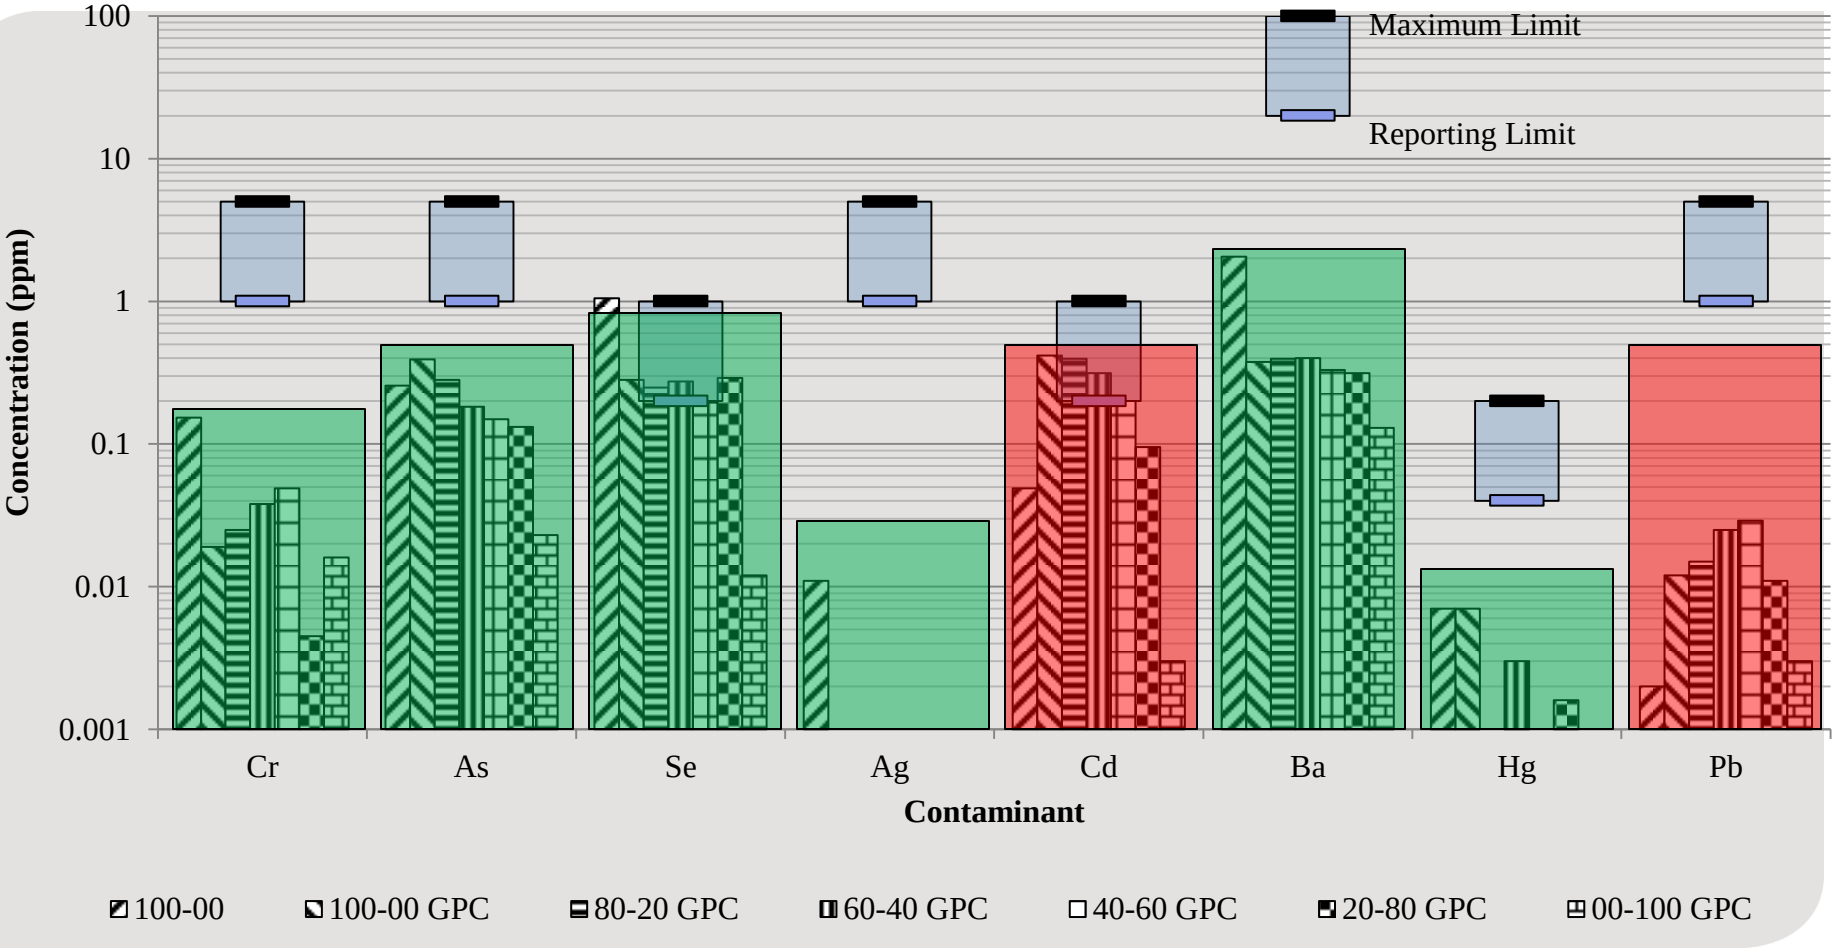
Leaching of Incinerator Fly Ash



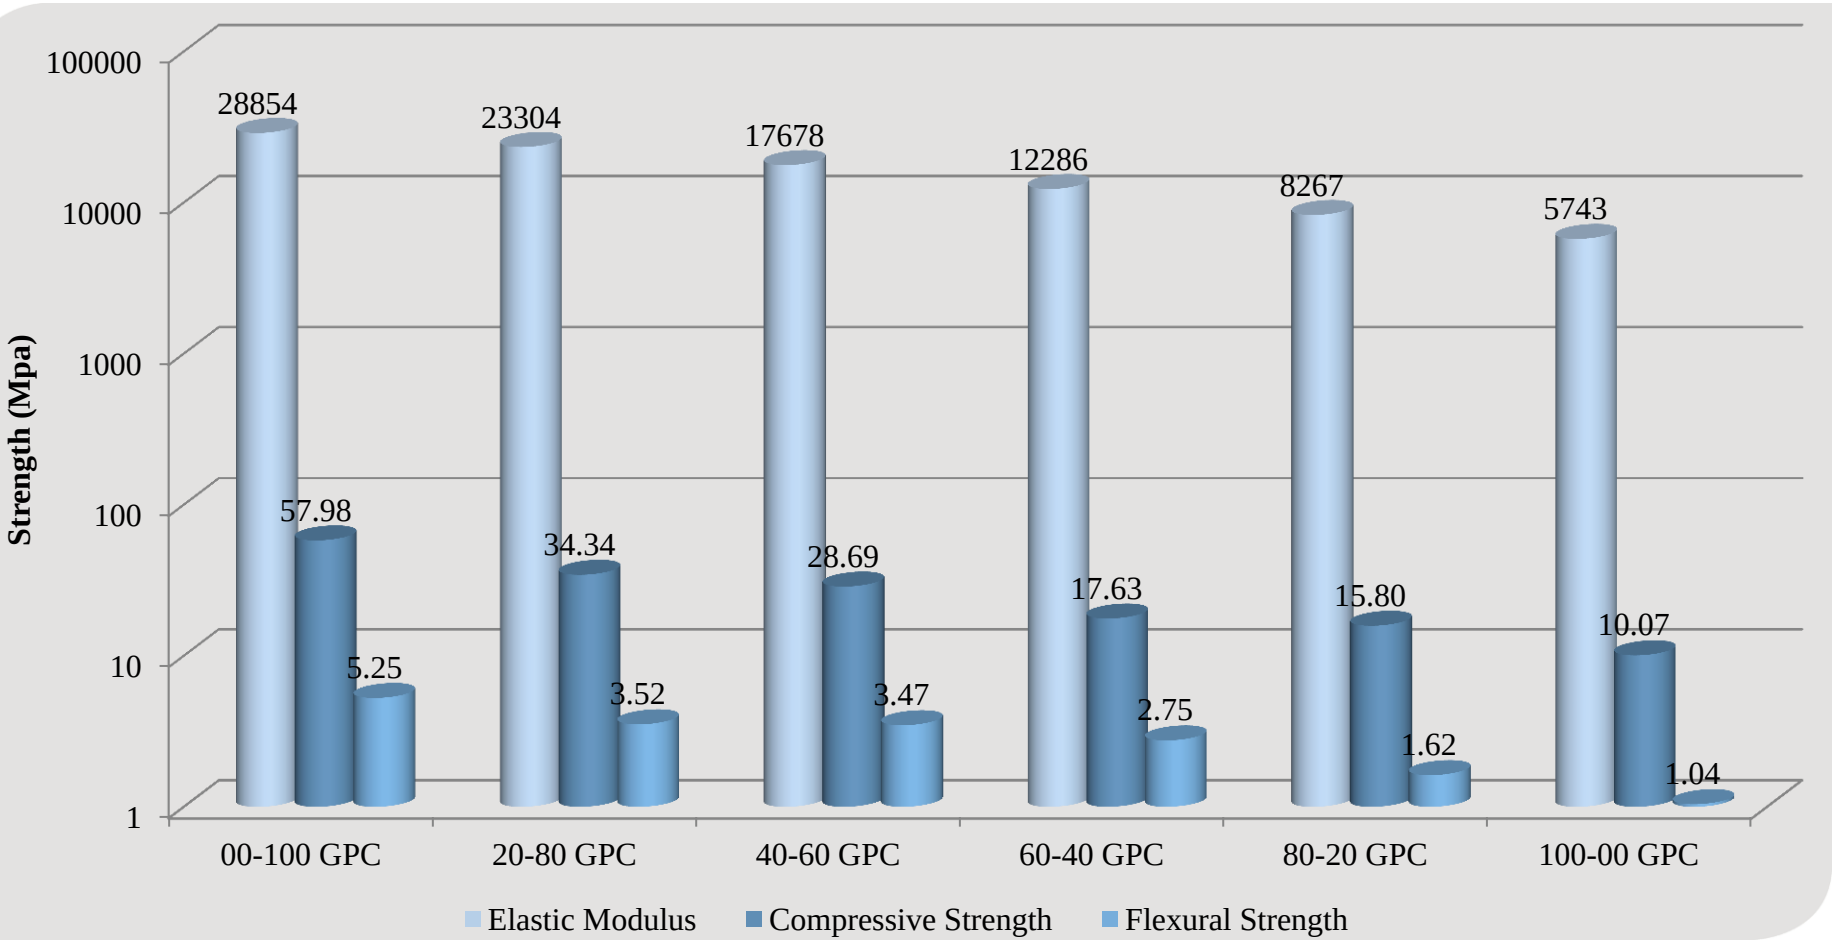
Toxicity Reduction in GPP



Toxicity Reduction in GPC



Mechanical Characterization of Concrete Samples



Conclusions

- The leachability of Cr, As, Se, Ag, Ba and Hg contained in IFA can be effectively reduced in a geopolymer concrete network
- No reduction in the leachability levels of Cd and Pb
- TCLP results and mechanical tests suggest that the concrete product could be used in construction applications

Thank you!
