Progress Update--
TVA Kingston Ash Recovery Project

TVA has moved aggressively to recover ash from the December 2008 Kingston fly ash spill and to evaluate environmental impacts of that spill. Over 3.5 million cubic yards of ash was removed from the Emory River and the river was re-opened to recreational boating less than 18 months after the spill. All of the ash recovered from the river has been shipped for disposal, plans have been developed and approved by regulatory agencies for recovery of the remaining ash from an adjacent embayment, and work is progressing to recover that ash and to evaluate the potential for long-term impacts to the local environment. In addition, TVA has worked with local elected officials and community representatives to coordinate plans and provide continuing opportunity for local input.

This presentation briefly reviews the history of the Kingston Ash Recovery Project describes plans and projected schedule for project completion, and provides an up-to-date progress report.
