**KEYWORDS:** TCLP, SPLP, MEP, Leachates

Events over the past years have brought fly-ash and other combustion products under continual scrutiny with regards to potential toxicity. Leachate procedures are commonly used to estimate the mobility and impact of the chemical constituents to the surrounding environment.

An overview and comparison of the most common leaching/extraction procedures as they are used in the fly-ash industry will be presented. A study of several class C and F fly-ash materials each tested using the most common leach procedure. is presented to help understand how the leaching procedures are different and how they are the same.,

**Submitted for consideration in the 2011 World of Coal Ash Conference,**

**May 9-12, 2011.**
